

PostX Corporate Overview

Since our inception as a pioneer in secure messaging, PostX has pursued a singular vision: to provide enterprises with secure email delivery of information essential to their business and customer relationships. Our production experience spans the financial services, telecommunications, insurance, and health care industries. PostX has enabled global organizations to meet the challenge of reconciling reliable and secure messaging with ease of use.

The PostX Messaging Application Platform provides an integrated trusted communication framework that is flexible enough to solve all your secure messaging requirements. It is offered in several configurations.

- PostX SecureEmail affords you the convenience of using email, today's communication channel of choice, while protecting privacy and maintaining compliance with regulatory legislation.
- PostX SecureDocument creates and securely delivers personalized electronic customer communications. With PostX SecureDocument your web portal extends to your customers' desktops, driving top line revenue and customer loyalty while reducing customer service costs.
- PostX InteractionHub provides a powerful platform for customers to manage their online interactions and communications to your service center. Its extensible,

open framework can be tightly integrated with in-house systems, such as Customer Relationship Management (CRM), single sign on, authentication, and messaging systems to provide the exact solution to your secure messaging requirements.

PostX ensures that security does not come at the expense of accessibility. With PostX, your customers will be able to open secure emails from any email platform on any operating system without installing new software on their desktops.

Based on an open architecture, the PostX Platform can readily be scaled to satisfy your current volume, performance, and redundancy requirements with maximum reliability and portability. And it is fully flexible to meet your future requirements across the full spectrum of secure messaging applications.

PostX Messaging Application Platform

The PostX Messaging Application Platform provides PostX solutions with a uniquely wide range of capabilities.

Universal reach

PostX communications have universal reach. PostX patented technology delivers secure messages to any email inbox regardless of the computer platform or email client. PostX communications work on PCs, Macs, and Unix workstations. Whether the recipient uses a desktop email application, such as Outlook or Notes, or a Web-based email system, such as AOL or Yahoo, no special software is needed to receive and read PostX communications.

Comprehensive delivery methods

PostX is the only solution that can support all your secure delivery requirements from a single platform. The PostX Envelope provides push delivery, distributing encrypted email directly to the customer's inbox. WebSafe, the PostX pull solution, stores messages centrally in an online message center. Additionally, PostX offers options for support of S/MIME and OpenPGP.

Recipient authentication

PostX offers a variety of authentication options, including support for LDAP lookup, single sign-on, directory chaining, and two-factor authentication. Whether you want a comprehensive user enrollment system or prefer to leverage existing enrollment systems, the PostX solution will meet your needs.

Encryption security

PostX security is based on the strongest, most widely accepted encryption algorithms. Each message is encrypted using a unique secure cryptographic key. Multiple encryption algorithms are supported, including ARC4 and AES, so that you can select the encryption method that best meets your needs.

In conjunction with the US Postal Service, PostX offers the USPS Electronic Postmark (EPM), providing complete tamper-detection and federal protection backed by the US Postal Service.

Message control

Access to messages sent using PostX Registered Envelopes or PostX WebSafe can be controlled individually. Using the web-based interface, administrators can expire selected messages manually or automatically after a specified interval. If a brute force attack occurs (or is suspected) PostX can automatically lock messages.

Message tracking and reporting

PostX offers complete tracking of message activity from the web-based administration interface. All message processing, delivery, and key retrieval activity is stored in an open database. When required customized audit reports can be easily created from the data base.

Administration and monitoring

PostX provides web-based administrative tools for day-to-day system management. A real-time dashboard gives you the ability to view system statistics and monitor mail spool queues tasks. The role-based management model enables you to authorize access and delegate administrative privileges to specific individuals.

Rapid deployment

PostX software installs easily using Wizard-based installation procedure. The web-based administration interface makes it simple to configure PostX software to meet the specific requirements of each application.

Enterprise-class scalability

PostX Messaging Application Platform is the only enterprise-class secure messaging solution available today. Its open architecture satisfies volume, performance, and redundancy requirements with maximum reliability. It can be deployed across multiple servers in clustered or load-balanced configurations to support the delivery of millions of documents per month. JPMorgan Chase uses PostX to provide secure customer service to a recipient community of over 30 million customers, and Charles Schwab offers secure email delivery of 401K statements to over 8 million customers.

PostX Messaging Application Platform is supported on multiple platforms, including Sun Solaris, AIX, Windows, and Linux, allowing you to select the hardware configuration most appropriate to your application and IT environment.
